### PRINCIPAL COMPONENT ANALYSIS: AN INDEX OF SOCIAL PROGRESS

Term 6, 2020

SINGAPORE UNIVERSITY OF  
TECHNOLOGY AND DESIGN

Opinion

# 'We're No. 28! And Dropping!'

A measure of social progress finds that the quality of life has dropped in America over the last decade, even as it has risen almost everywhere else.

# Social Progress Index

*The Social Progress Index is a well-established measure, published since 2013, that is meant to catalyze improvement and drive action by presenting social outcome data in a useful and reliable way. Composed of multiple dimensions, the Social Progress Index can be used to benchmark success and provide a holistic, transparent, outcome-based measure of a country's well-being that is independent of economic indicators. Policymakers, businesses, and countries' citizens alike can use it to compare their country against others on different facets of social progress, allowing the identification of specific areas of strength or weakness.*

# Supervised learning vs. Unsupervised learning

|            | Supervised learning   | Unsupervised learning  |
|------------|---|--|
| Data       | Data is labelled. Output: $y$ , input: $x_1, \dots, x_p$ .              | Unlabelled data. Only input: $x_1, \dots, x_p$ .                         |
| Goal       | Predicting the response, classifying, etc.                              | Not direct. Understanding the structure. Clustering, dimension reduction |
| Assessment | Break into training and test sets and validate                          | Difficult  |
| Methods    | Regression (linear, logistic, ...), Random forests, decision trees, ... | PCA, SVD, k-means, hierarchical clustering, ...                          |

# Principal Component Analysis

We observe the  $n \times p$  data matrix:

$$\mathbf{x} = \begin{bmatrix} x_{11} & \dots & x_{1p} \\ \vdots & \ddots & \vdots \\ x_{n1} & \dots & x_{np} \end{bmatrix} =: \begin{bmatrix} \underline{x}_1^T \\ \vdots \\ \underline{x}_n^T \end{bmatrix}$$

- ❶  $n$  = Number of observations
- ❷  $p$  = Number of predictor variables
- ❸  $X_1, \dots, X_p$  = Independent variables

# PCA

Can we find  $Z_1, \dots, Z_q$  with  $q \ll p$  such that

$$Z_1 = \phi_{11}X_1 + \phi_{21}X_2 + \dots + \phi_{p1}X_p = \underline{X}^T \underline{\phi}_1,$$

$$\vdots$$

$$Z_q = \phi_{1q}X_1 + \phi_{2q}X_2 + \dots + \phi_{pq}X_p = \underline{X}^T \underline{\phi}_q,$$

# PCA: linear algebra

➊ Any symmetric matrix  $A$  has  $n$  orthonormal eigenvectors  $\underline{v}_1, \dots, \underline{v}_n$  and associated eigenvalues  $\lambda_1, \dots, \lambda_n$  respectively such that for  $1 \leq i, j \leq n$ ,

➊  $A\underline{v}_i = \lambda_i \underline{v}_i$ ,

➋  $\underline{v}_i^T \underline{v}_i = 1$ ,

➌  $\underline{v}_i^T \underline{v}_j = 0$  for  $i \neq j$ .

Moreover,  $\underline{v}_i \in \mathbb{R}^n$  and  $\lambda_i \in \mathbb{R}$ .
